[Heat Stroke: Background, Pathophysiology, Etiology](#)

Heat illness may be viewed as a continuum of illnesses relating to the body's inability to cope with heat. It includes minor illnesses, such as heat edema, heat rash (ie, prickly heat), heat cramps, heat tetany, as well as heat syncope and heat exhaustion.

[Heatstroke Thermoregulation, Pathophysiology and ...](#)

Heat stress is the mildest form of heat-related illness, and heatstroke is the most severe (TABLE 1). Numerous definitions have been proposed to describe the intricate disease process of heatstroke. In humans, the classic definition is a severe illness characterized by a core temperature >104 F (>40 C) and central nervous system abnormalities; however, a more thorough definition of
